

Wedding Hall Price Prediction — Machine Learning

Notebook: `Wedding\_Hall\_Prediction\_Model.ipynb`

Dataset: `Venues\_data.csv` (keep in same folder or update path in notebook)

Project goal

Use machine learning to predict venue price (Menu Price) for wedding halls based on venue attributes such as type, ratings, reviews, rooms, capacity (Pax Min/Max), and amenities.

What this notebook contains

- Data loading (from `Venues\_data.csv`)
- Data cleaning and preprocessing (handling missing/zero values, encoding categorical features, scaling where needed)
- Feature engineering / selection steps applied before modelling
- Model training and comparison of multiple regressors
- (Examples included: Linear Regression, Decision Tree Regressor, Random Forest Regressor)
- Model evaluation using regression metrics (R^2 , MAE, RMSE)
- Final model selection and brief conclusion (Decision Tree performed best in this notebook)
